Decoding Sustainability Communication via NLP

NILS.HOLMBERG@IKO.LU.SE | EUPRERA 2025, LUND

Introduction

- Sustainability websites = transparency + persuasion
- Signal legitimacy and engage stakeholders
- Shell = technical; WWF = emotional
- Manual coding vs. scale/nuance
- **Aim:** Use NLP to compare Shell vs WWF

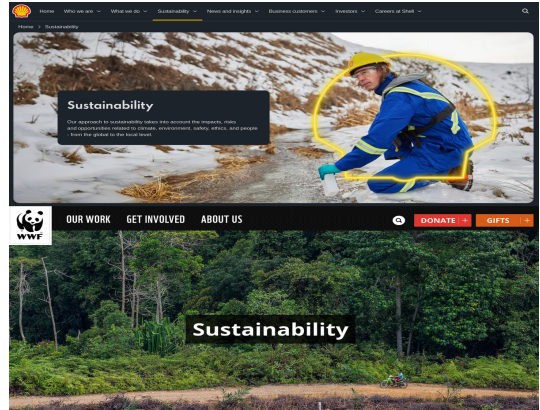

Diagram: corp vs NGO

Stakeholder Theory Expectations

- Message shaped by stakeholders
- Shell: investors/regulators = "investment", etc.
- WWF: donors/public = "donor", "nature"
- Shell: data-driven; WWF: community focus
- **Expectations of lexical analysis**

Type	Term
Economic, Regulatory	investment
Economic, Regulatory	emission
Economic, Regulatory	energy
Community, Environment	donor
Community, Environment	conservation

Graphic: stakeholder mapping

Framing Theory Expectations

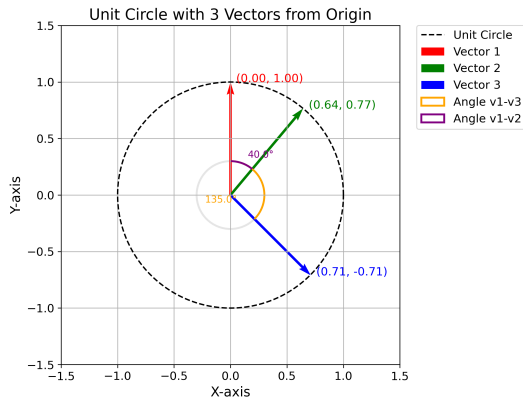

- Framing guides perception
- Shell: optimistic "innovation" frame
- WWF: moral/problem frame ("action", "duty")
- Shell: business advantage; WWF: urgency
- **Expectations of lexical analysis**

Type	Term
Opportunity	innovation
Opportunity	technology
Moral	duty
Moral	crisis
Moral	action

Diagram: framing strategies

Data & Methodology

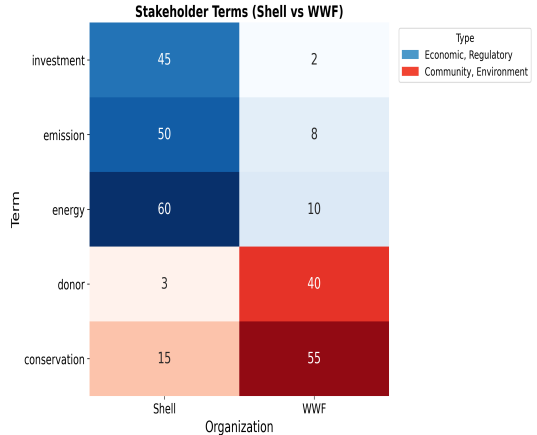

- 7 webpages each from Shell and WWF
- Cleaned HTML, kept main content
- SpaCy tokenization, lemmatization
- Lexical: count theory-based keywords
- Semantic: BERT embeddings + similarity

Cosine similarity of vectors

Lexical Analysis Results (1)

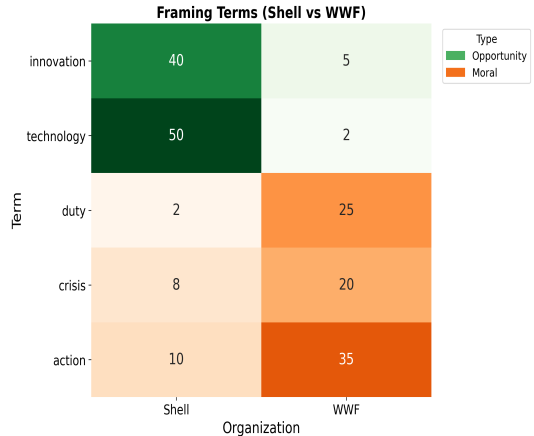

- Shell: "energy", "emission", "investment"
- WWF: "conservation", "donor", "nature"
- Terms rarely overlap between orgs
- Shell = tech & opportunity; WWF = duty & action
- Clear lexical patterns match theory

Example stakeholder word counts

Lexical Analysis Results (2)

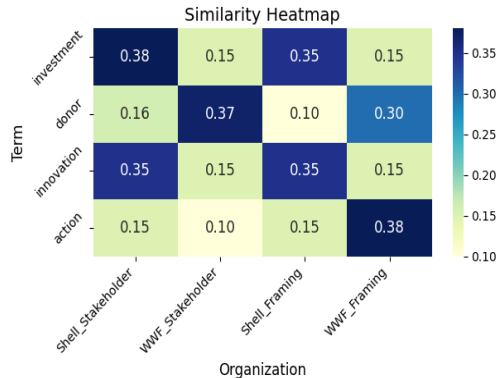

- Shell: "innovation", "technology"
- WWF: "duty", "crisis", "action"
- Terms contrast between orgs
- **Shell = economic/regulatory & opportunity**
- **WWF = community/environment & moral**

Example framing word counts

Semantic Similarity (BERT)

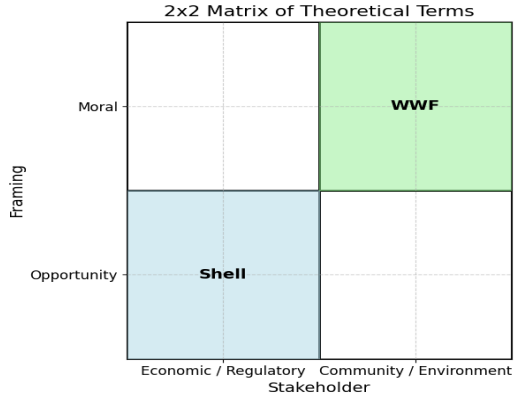

- Theoretical terms vs. empirical sentences
- Shell sentences align mostly with economic stakeholders and opportunity framing
- WWF sentences align mostly with community stakeholders and moral framing

Terms vs. sentences similarity

Theoretical Implications

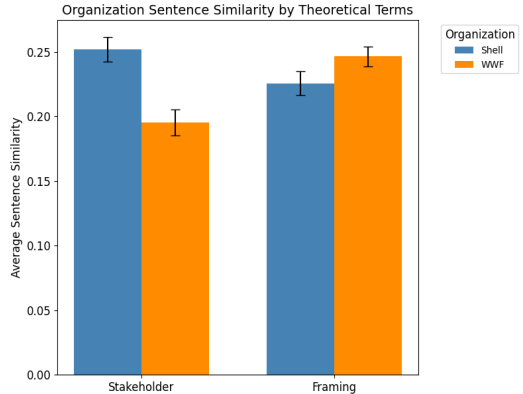

- Shell confirms stakeholder focus
- WWF shows moral advocacy focus
- Shell = opportunity frame; WWF = moral frame
- NLP helps apply and refine both theories
- NLP = replicable insight, not anecdotal

Concept map: theory + findings

Communication Implications

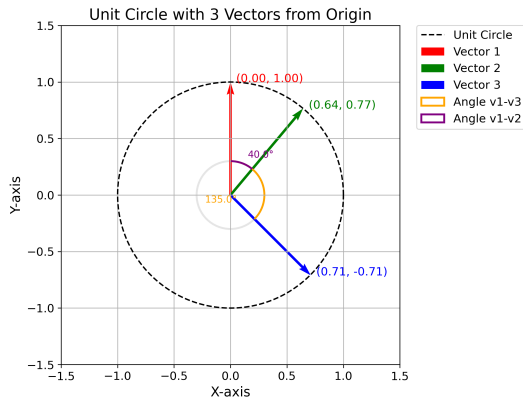

- Overall content similarity to theories
- Shell = competence; WWF = emotional appeal
- Tailored messaging for each audience
- Firms = clarify tech; NGOs = build urgency

Icons: tech vs moral appeals

Scalable Analysis

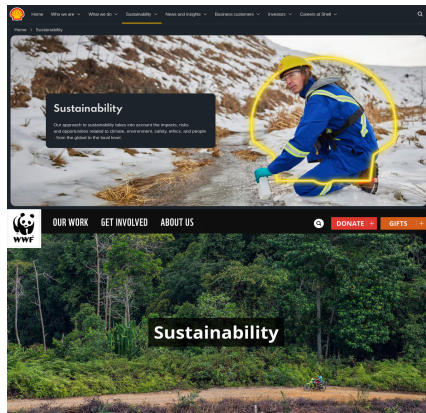

- Method scales to 100s of sites
- Cloud + BERT = efficient workflows
- Topic models could reveal trends
- Text + image data can be fused
- Big data boosts theory + practice

Cloud or NLP infrastructure diagram

Conclusion & Future Directions

- NLP reveals Shell vs WWF messaging logics
- Confirms stakeholder + framing theory
- Lexical + semantic = stronger analysis
- Actionable insights for communication design
- Future: multimodal + large-scale studies

Multimodal analysis, multiple communication areas
